The Superstore Retail Analytics Dashboard
Project abstract

Our team will develop an interactive Power BI dashboard to analyze sales and profitability trends for a retail superstore using the publicly available "Superstore" dataset. The project's goal will be to help business stakeholders in determining which products, markets, clientele, and shipping options will be most important to focus on. Instead of depending only on static reports, we will clean and model the dataset, create connections, and create calculated measures (for KPIs like total sales, total profit, YoY trends, and delivery performance) so that decision-makers can look at performance from multiple angles.

The dashboard will be made to address important business queries like:

- Which categories and subcategories will generate the most revenue?
- Which states and regions will make the largest revenue contributions?
- Do any shipping options or special offers have the potential to lower profitability?

Visual aids such as KPI cards, donut charts for category/segment breakdowns, a map showing state-by-state performance, bar charts for the "Top 10 states," and line charts for monthly trends will all be used. As a result, users will be able to quickly see how performance will vary across regions by filtering by Central, East, South, and West.

In conclusion, this work demonstrates how BI tools can transform transactional data into strategic intelligence. The project emphasises how crucial interactive dashboards are for empowering stakeholders to improve operational transparency, make evidence-based decisions, and maximise business results.
